TITLE:

Solutions of Second Order Non-Linear Differential Equations With Slowly Varying Coefficients (O resheniyakh nelineynykh differentsial nykh uravneniy vtorogo poryadka s medlenno izmenyayushchimisya koeffitsiyentami)

PERIODICAL:

Doklady Akademii Nauk SSSR,1957, Vol.114, Nr 6, pp.1149-1152(USSR)

ABSTRACT:

The posing of the problem: The author here examines an equation of the type

 $\frac{d}{dt}\left[m(\varepsilon t)\dot{x}\right] + \varepsilon f\left(\varepsilon t, x, \dot{x}\right) + Q(\varepsilon t, x) = 0$

where the small parameter ε characterizes the slowness of the variation of the functions m, f, Q with increasing time. In the present paper the amplitude and the period are calculated with an accuracy of up to and including quantities of the order of magnitude ε for the interval $t \sim 1/\varepsilon$. The terms of a magnitude ε^2 and more can be left out. After some steps of calculation the following equation, which is discussed in this paper, is obtained:

Card 1/3

2: 4-6-3/54 Solutions of Second Order Non-Linear Differential Equations With Slowly Varying Coefficients

$$\frac{d}{dt} \left[m(\varepsilon t) \dot{x} \right] + q(\varepsilon t, x) + \varepsilon \varphi_1(\varepsilon t, x, \dot{x}) + \varepsilon \varphi_2^2(\varepsilon t, x, \dot{x}) + \varepsilon^3 \varphi_3(\varepsilon t, x, \dot{x}) + \dots = 0.$$

If the condition sign Q = sign x is satisfied and if several other limitations are taken into account, the solution of the last mentioned equation (provided that the initial conditions $x(0) = x_0, \dot{x}(0) = \dot{x}_0, \dot{x}^2 + \dot{x}^2 \neq 0$ are satisfied), oscillates, when ε are sufficiently small, with a slowly varying amplitude and period within the interval $t \sim 1/\varepsilon$. On that occasion the positive maxima and the negative minima alternate, and between, the solution monoton ously varies. Formulae are derived for the amplitude and for the period which describe these quantities with an accuracy of up to and including ε in the interval $t \sim 1/\varepsilon$. First the equation of zeroth approximation for the amplitude and for the period are given and physically interpreted. An equation is then given for the variation of the action integral in time. Thereafter the higher approximations are discussed. The equations with higher approximations are linear, too. Finally, the conditions of applicability of the

Card 2/3

20-114-6-3/54 Solutions of Second Order Non-Linear Differential Equations With Slowly Varying Coefficients

equations of zeroth and first order are discussed.

TITLE:

Periodical Solutions of a Nonlinear Equation for Autooscillations (O periodicheskikh resheniyakh nelineynogo

uravneniya avtokolebaniy).

PERIODICAL:

Doklady Akademii Nauk SSSR, 1957, Vol. 115, Nr 1, pp. 20-22 USSR)

ABSTRACT:

The present paper studies the periodic solutions of the nonlinear equations of autooscillations of the type $\ddot{x}+Q = \mathcal{E}f(x,\dot{x},\mathcal{E})$ where \mathcal{E} is a small parameter. $Q = \text{sign } x \text{ and } \int_{0}^{\infty} Q(x) dx = \infty$ applies.

Then the periodic equation $x + Q(x_0) = 0$ has only periodic solutions. The perturbed equation $x + Q(x) = \mathcal{E}f(x, x, \mathcal{E})$ will not have periodic solutions under all but only under certain special initial conditions. The present paper gives formulae for the calculation of the chief characteristics of the periodic solutions (amplitude and period) of the perturbed equation. In this connection these values shall be immediately expressed by Q and f. Then aperiodic solutions can in the case of $t \rightarrow \infty$ without restriction approach these periodic solutions or withdraw from them. A criterion for the stability of the periodic solution of this

Card 1/2

Periodical Solutions of a Nonlinear Equation for Autooscillations. 20-1-4/54

perturbed equation is given, and in this criterion only the

functions Q, f occur.

Q and f for all values of x and \hat{x} in the case of all sufficiently small $\hat{\mathcal{E}}$ are regular with regard to $x,\hat{x},\hat{\mathcal{E}}$. The author seeks a periodic solution of the perturbed equation which in a certain environment of $\hat{\mathcal{E}}=0$ analytically depends on $\hat{\mathcal{E}}$. The periodic solution of the perturbed equation (which in the case of $\hat{\mathcal{E}}=0$ does not change over to the trivial solution x=0 of the unperturbed equation) oscillates in the case of a sufficiently small $\hat{\mathcal{E}}$ about the t-axis and alternatingly has positive maxima and negative minima between whom lies one zero respectively. Other extrema are absent and the curve $x(t,\hat{\mathcal{E}})$ monotonously varies between the maxima and minima. There is no figure.

TITLE:

On the Solutions of Some Disturbed Systems in the Neighborhood of Periodic Motions (O resheniyakh nekotorykh vozmushchennykh sistem v okrestnosti periodicheskikh dvizheniy)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 4, pp 587-590 (USSR)

ABSTRACT:

In a domain let the undisturbed system $\vec{x} = \vec{F}(x_1, x_2, \dots, x_n)$ have only periodic solutions $\vec{x} = \vec{x}_0(C, \varphi)$; here \vec{x} and \vec{F} are n-dimensional vectors and \overline{C} is an (n-1)-dimensional vector. The author seeks approximate solutions of the disturbed system

 $\vec{x} = \vec{f}(x_1, \dots, x_n) + \mathcal{E}f(x_1, \dots, x_n, \mathcal{E})$, where \mathcal{E} is a small

parameter. The construction of the approximate solutions is made by an asymptotic expansion of the unknown functions $\overline{C}(t,\mathcal{E})$ and $\varphi(t,\mathcal{E})$, i.e. by variation of the constants \overline{C} and φ . Only equations of first order for the determination of the zero approximation of C and P are given explicitly. According to the author, the higher approximations lead to very extensive expressions. As simpler special cases the author considers periodic solutions of the disturbed system, canonical systems with a Hamiltonian function, oscillation equations

Oscillation Equations With Slowly Variable Parameters (Uravneniya TITLE: kolebaniy s medlenno izmenyayushchimisya parametrami)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 121, Nr 1, pp 22-25 (USSR)

The author considers the system ABSTRACT:

 $\frac{\mathrm{d}}{\mathrm{d}t}\left[\mathbf{m}(\vec{x})\dot{\mathbf{x}}\right] + \mathbf{Q}(\vec{x},\mathbf{x}) = \mathcal{E}t(\mathbf{x},\dot{\mathbf{x}},\vec{x}), \quad \vec{x} = \mathcal{E}\vec{\varphi}(\mathbf{x},\dot{\mathbf{x}},\vec{x}),$ where \mathcal{E} is a small parameter and $\mathcal{A} = \{ \gamma_1, \gamma_2, \dots, \gamma_n \}$, $\mathcal{A} = \{ \gamma_1, \dots, \gamma_n \}$. The first equation is the oscillation of the

variable mass m, the second equation describes the variation of the parameters M_i . Under the assumptions 1) sign Q = sign x,

2) $m(\vec{x})\dot{x} + Q(\vec{x},x) = 0$ has only periodic solutions in a certain domain of initial values and of the M, the solution x(t, E) of (1) for sufficiently small Eoscillates around the equilibrium position x = 0, where the maxima and minima relieve one another. The author's principal result consists in the statement that there exist functions $F_1(\xi t) < 0$, $F_2(\xi t) < 0$ and $\mathcal{F}(\xi t)$ which on the

interval $t \sim 1/\epsilon$ determine the maxima and the minima of $x(\ell,t)$ and the variation of M with the exactness & . Here

The Asymptotic of the Integrals of Some Disturbed Systems

(Asimptotika integralov nekotorykh vozmushchennykh sistem) PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 121, Nr 6, pp 959-962 (USSR)

ABSTRACT:

The author considers the undisturbed system (1) $\dot{x}_0 = M(x_0, y_0, \overrightarrow{p}_0)$, $\dot{y}_0 = N(x_0, y_0, \overrightarrow{p}_0)$ and the disturbed system

(2) $\dot{x} = M(x,y,\overrightarrow{p}) + \mathcal{E}f^{(y)}(x,y,\overrightarrow{p}), \quad \dot{y} = N(x,y,\overrightarrow{p}) - \mathcal{E}f^{(x)}(x,y,\overrightarrow{p})$ where the vectors \overrightarrow{p} and \overrightarrow{p} represent the system parameters. Under the assumption that (1) has periodic solutions and that it admits a bounded, sufficiently smooth integrating factor, the author reduces system (2) to a system with a quickly rotating phase (see Bogolyubov [Ref 2]). The first approximation of the solutions of this system is reached by averaging according to Bogolyubov. This approximation describes the behavior of the new variable on the interval t ~ 1/E with the exactness ~ E. The

TITLE: Averaging of Some Perturbed Motions PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 2, pp. 261-264

TEXT: Civen the undisturbed system

 $\dot{x} = F(x,y) | \dot{y} = \phi(x,y)$

where x, F and y, ϕ are n- and m-dimensional vector functions, respectively. Let F, ϕ be periodic in y_1, y_2, \dots, y_m with the periods $x_1, x_2, \dots, x_m \neq 1$ \neq 0. Let the solution of (1) depend on n + m constants, where the x_i in t have the period To depending on n + m - 1 constants, and the y have increases in the time $\triangle t = T_0$ which are equal to the T_j (j = 1, 2, ..., m). Then the solution of (1) has the form

 $x = x_0(c, \psi), y = \frac{T\psi}{2\pi} + y_0(c, \psi)$, Card 1/3

Averaging of Some Perturbed Motions

s/020/60/133/02/03/068 c111/c222

where c are the constants, ψ is the phase and $T = \{T_1, T_2, \dots, T_m\}$; T_0 and T_0 are 2K - periodic in ψ . Beside of (1) the author considers the per-

turbed system $(4) \dot{x} = F(x,y) + \mathcal{E}f(x,y,\mathcal{E}) , \dot{y} = \phi(x,y) + \mathcal{E}\phi(x,y,\mathcal{E}) ,$

where f and φ in the y_j are periodic with the periods T_j . For small ε the author investigates the solutions of (4) in the neighborhood of the solutions of (1) on large intervals of time $t \sim 1/\varepsilon$. By a variation of the constants of (1) on large intervals of time $t \sim 1/\varepsilon$. By a variation of the constants of $t = \{c_1, c_2, \cdots, c_{n+m-1}\}$ and the phase ψ the author aspires to a representation of the solution of (4) in the form (2). For the determination of the ation of the solution of (4) in the form (2). For the determination of the ation of the solution of (4), ψ the author obtains equations from which by an asymptotic averaging (Ref. 1) arbitrarily high approximations for which by an asymptotic averaging (Ref. 1) arbitrarily high approximations for which by an asymptotic averaging (Ref. 1) arbitrarily high approximations for which by an asymptotic averaging (Ref. 1) arbitrarily high approximations for which by an asymptotic averaging with slowly variable parameters and the same problem is treated for equations with slowly variable parameters and for systems similar to the canonical systems.

Averaging method

PERIODICAL: Akademii nauk SSSR. Doklady, v. 137, no. 1, 1961, 21 - 24

TEXT: Given the system

$$\dot{x} = \xi X(x,y,t,\varepsilon), \quad \dot{y} = Y(x,y,t,\varepsilon),$$
 (1)

where x,X and y,Y are n and m-dimensional vectors, respectively, $\varepsilon > 0$ is a small parameter. Let the general solution of the degenerated system ($\varepsilon = 0$)

$$\dot{y} = Y(x,y,t,0) \equiv Y_0(x,y,t), x = const$$
 (2)

be known and let

$$y = \varphi(x, y_o t_o, t) \quad (\varphi(x, y_o, t_o, t_o) \equiv y_o, \quad rank \left\| \frac{\partial \varphi}{\partial y_o}, \quad \frac{\partial \varphi}{\partial t_o} \right\| = m)$$
 (3)

Let the right sides of (1) and other appearing functions have mean values Card 1/4

3/020/61/137/001/002/021 C111/C222

Averaging method

along every solution of (2) which do not depend on y_0 and t_0 . It is shown that this assumption does not weaken the generality. Let

be the averaged system.

Problem: Compare the solutions of (1) and (4) on a large interval of $t\sim 1/\epsilon$ and construct averaged systems of higher order

$$\frac{\dot{\overline{x}}}{\overline{x}} = \varepsilon \overline{X}_{1}(x) + \varepsilon^{2} A_{2}(\overline{x}) + \varepsilon^{3} \cdot \cdot \cdot ,$$

$$\frac{\dot{\overline{y}}}{\overline{y}} = Y_{0}(\overline{x}, \overline{y}, t) + \varepsilon B_{1}(\overline{x}) + \varepsilon^{2} B_{2}(x) + \varepsilon^{3} \cdot \cdot \cdot . \qquad (5)$$

For the solution, (1) is written in the form

$$\dot{x} = \xi X_1 x, y, t + \xi^2 X_2 (x, y, t) + \xi^3 ...,
\dot{y} = Y_0 (x, y, t) + \xi Y_1 (x, y, t) + \xi^2 Y_2 (x, y, t) + \xi^3 ...$$
(6)

The author seeks a transformation Card 2/4

Averaging method

S/020/61/137/001/002/021 C111/C222

$$x = \overline{x} + \varepsilon u_1(\overline{x}, \overline{y}, t) + \varepsilon^2 u_2(\overline{x}, \overline{y}, t) + \varepsilon^3 \dots,$$

$$y = \overline{y} + \varepsilon v_1(\overline{x}, \overline{y}, t) + \varepsilon^2 v_2(\overline{x}, \overline{y}, t) + \varepsilon^3 \dots$$
(7)

for (6) which leads to (5). By differentiating (7), using (5), and a comparison of coefficients one obtains an infinite system for the terms of (5), (7), where the functions A_2 , A_3 ,..., B_1 , B_2 , ... in general can be chosen arbitrarily. For u_1 , v_1 , u_2 , v_2 , ... one obtains equations of the type

$$\frac{\partial \mathbf{u}_1}{\partial \mathbf{u}} + (\mathbf{Y}_0 \frac{\partial \mathbf{y}}{\partial \mathbf{y}}) \mathbf{u}_1 = \mathbf{X}_1 - \overline{\mathbf{X}}_1 \equiv \mathbf{S} \tag{8}$$

$$\frac{\Im \mathbf{v_1}}{\Im \mathbf{t}} + (\mathbf{Y_0} \frac{\Im \mathbf{y}}{\Im \mathbf{y}}) \mathbf{v_1} - (\mathbf{v_1} \frac{\Im}{\Im \mathbf{y}}) \mathbf{Y_0} = \mathbf{R}$$
 (9)

which can be solved successively since the solutions of the characteristic systems are known. Thus the formal developments (5), (7) can be determined arbitrarily far.

The foundation of the method is carried out under ten assumptions the Card 3/4

20312 \$\020\61\137\001\002\021 \$\0111\0222

Averaging method

control of which is partially difficult. The possibility of application of the method to more general systems, systems with slowly variable parameters, and systems with a quickly rotating phase (special case) is considered briefly.

There are 6 Soviet-bloc references.

Averaging on an unbounded interval

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 145, no. 5, 1962, 965-966

TEXT: Two previous papers by the author (DAN, 137, No. 1, 21 (1961); No. 5, 1022 (1961)), contain certain theorems concerning an asymptotic method for the system $\dot{x} = \varepsilon X(x,y,t,\varepsilon)$, $\dot{y} = Y(x,y,t,\varepsilon)$ ($x = \{x_1, \dots, x_n\}$, $y = \{y_1, \dots, y_m\}$, $X = \{x_1, \dots, x_n\}$, $Y = \{Y_1, \dots, Y_m\}$, $\varepsilon > 0$), which is connected with an averaging along the integral curves of the degenerated system x = const, $\dot{y} = Y(x,y,t,0)$. Those theorems refer to a large bounded time interval and cannot be applied immediately to an unbounded interval. That is done in the present paper by requiring the asymptotic stability of certain solutions of the degenerated system and of the system averaged in first approximation.

TITLE:

Averaging in certain systems of differential equations

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 145, no. 4, 1962, 713 - 715

TEXT: For purposes of averaging, systems of the form $\dot{x} = \mathcal{E} X(x,y,t,\mathcal{E})$, $\dot{y} = Y(x,y,t,\mathcal{E})$ are reduced to the degenerate system x = const, $\dot{y} = Y(x,y,t,0)$. Unlike what has been done in previous papers (V. M. Volosov, DAN, 137, No. 1, 21 (1961); No. 5, 1022 (1961)), it is assumed that the average values of certain functions vary along the trajectories of the degenerate system. The two theorems derived contain estimates of the deviations of the exact solutions from the average solutions.

TITLE: Asymptotics of certain rotary motions Presented by Academician I. G.

SOURCE: AN SSSR. Doklady*, v. 151, no. 6, 1963, 1260-1263

TOPIC TAGS: motion, rotary motion, nonperturbed system, perturbed motion, freedom degree

ABSTRACT: The present work is a continuation of previous investigations by the author of systems with a single degree of freedom in which the solution of a non-perturbed system is described by an oscillating process. Amplitude curves, the period and other parameters were found for such systems in first or second approximation. The rotational processes of such systems are analyzed in this paper, by previously described methods, by finding in first approximation the slowly changing function E (£,t) describing in first approximation the energy of the perturbed motion (where £ is a small parameter) and finding in the same approximation the slowly changing parameters in the given universe. Volosova, L.L. AUTHOR:

Process of mixture formation in gas burner equipment

PERIODICAL: Referativnyy zhurnal, Elektrotekhnika i energetika, TITLE:

1961, No.6, p.8, abstract 6G52. (Sb. 3-e Vses.

soveshchaniye po teorii goreniya. T.2.; M., 1960,

238-249)

The influence was investigated of a number of factors on the process of mixing of streams under conditions which approach those pertaining to work of industrial burners for burning natural gas in the furnaces of large power station boilers. In the experiments the gas was simulated by heated air. The character of mixing of the flows was determined from the temperature fields of the air stream on analogues of circular burners with central and peripheral input. The following relations were derived. 1. The degree of mixing of two flows depends strongly on the length of the mixing zone and increases rapidly with increasing length, both in unbounded space as well as in space bounded by an embrasure.

Card 1/2

APPROVED FOR RELEASE: 08/09/2001 CIA-RDP86-00513R001860720003-4" Process of mixture formation in ... S/196/61/000/006/007/014 E073/E535

2. Twisting the air or the gas-air mixture flow by blade cascades brings about a deterioration in the process of mixing.

3. By varying the ratio of the flow speeds it is possible to obtain differing concentrations of the field across the section of the burners and thus it is possible to improve or impair the process of mixture formation.

1960. 238 - 249)

TEXT: Models of almost natural size were employed to study the mixture formation in various torches. The gas was modelled by air, heated to 100-120°C. The nature of mixing was determined by measuring temperature fields. The degree of mixing of two gas flows depends considerably on the length of the mixing zone and increases rapidly with its extension in both a restricted and unrestricted space. Whirling of the air or the gas-air mixture with blade paddles (lapatochnyy registr) in torches with central or peripheral gas feed does not increase the degree of mixing, but, on the contrary, impairs the mixing process. An increase of the whirling angle from 45 to 60° causes greater non-uniformity of the gas con-

PERIODICAL:

Geodeziya i kartografiya, 1959, Nr 3, pp 76-78 (USSR)

ABSTRACT:

The Conference convened by the Presidium of the AS USSR was held from January 26 to 31, 1958 at the Institut geografii AN SSSR (Geographic Institute of the AS USSR). It dealt with the present state of the transliteration of geographic names and with the ways of rapidly eliminating various deficiencies. The Conference was attended by 89 delegates from various organizations and scientific centers. Chairman was the Assistant Director of the Geographic Institute of the AS USSR, Professor E. M. Murzayev. The following lectures were heard: M. B. Volostnova and S. A. Tyurin "Activity in the Field of Transliteration at the Glavnoya upravleniye geodezii i kartografii (Central Administration of Geodesy and Cartography)". There is already a card file with about 1,000,000 cards. A permanent commission for transliteration problems was formed in 1950.

M. Kh. Baranov analyzed the general state of transliteration

Card 1/2

Conference on Problems of the Transliteration of Geographic Names

sov/6-59-3-15/16

of geographic names and suggested that an All-Union Communittee for the transliteration of geographic names be established. P. K. Makayuda illustrated the activity at the Gidrograficheskaya sluzhba VMF (Hydrographic Service of the Navy) with respect to the transliteration of geographic names. Ye. M. Pospelow reported on "The Situation of Transliteration Abroad". He pointed out that on the whole the foreign transliteration authorities cannot serve as an example, but some positive aspects can and must be made use of. E. M. Murzayev lectured on "Local Geographic Terms". In the course of discussions the necessity became evident of putting order into the problems of transliterating the names of foreign persons into the Russian language, and also into the problem of transliterating Russian and foreign names into the languages of the peoples of the USSR. The Conference decided to ask the Council of Ministers of the USSR that a central coordinating organ be created. It should be entitled to supervise the transliteration of geographic names and names of persons in the USSR and to exert control on the transliteration activity all over the USSR.

TITLE: A model of a propeller (vaned wheel) for experimentation in a wind tunnel. Class 62, No. 183600				
SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 145				
TOPIC TAGS: propeller blade, aircraft propeller, wind tunnel, aerodynamics	•			
ABSTRACT: This Author Certificate presents a model of a propeller (vaned wheel) for experimentation in a wind tunnel. To obtain reliable aerodynamic characteristics for spinning propeller (vaned wheel) models at Re numbers smaller than those corresponding to the self-modeling regime of overflowing, the leading part of the blade profile carries openings of a small diameter. These openings serve as a turbolizer.	•
